this book explores the premise that a physical theory is an interpretation of the analytical canonical formalism throughout the text the investigation stresses that classical mechanics in its lagrangian formulation is the formal backbone of theoretical physics the authors start from a presentation of the analytical canonical formalism for classical mechanics and its applications in electromagnetism schrödinger's quantum mechanics and field theories such as general relativity and gauge field theories up to the higgs mechanism the analysis uses the main criterion used by physicists for a theory to formulate a physical theory we write down a lagrangian for it a physical theory is a particular instance of the lagrangian functional so there is already an unified physical theory one only has to specify the corresponding lagrangian or lagrangian density the dynamical equations are the associated euler lagrange equations the theory of suppes predicates as the main tool in the axiomatization and examples from the usual theories in physics for applications a whole plethora of results from logic that lead to interesting and sometimes unexpected consequences this volume looks at where our physics happen and which mathematical universe we require for the description of our concrete physical events it also explores if we use the constructive universe or if we need set theoretically generic spacetimes
